

THE TECHNO GRIND

Monthly Publication by Queppelin

QUEPPELIN DEVELOPED A MACHINE LEARNING BASED AUDIO SPECTRAL IMAGING AND GENRE CLASSIFICATION

We listen to various kinds of music ranging multiple genres. Various new songs/albums are released every day. Music platforms need to analyze songs to group them according to genres and identify various song attributes.

Queppelin has developed a Machine Learning based application to do this which eliminates manual intervention and automates the process completely making the operation fast to process millions of songs. This platform will serve as a base for music recommendation engines.
